

# BLACK ARM

3-AXIS-STABILIZING SYSTEM WITH  
ANTI-VIBRATION-MOUNT

The Black Arm is a 3-axis dampening system with an additional vibration mount for stabilizing roll and tilt errors as well as vertical motion and vibrations. The Black arm is a hardmount system made for gimbals that you want to mount on vehicles such as cars, ATVs, boats, snowmobiles etc.

A standard metal tube with a diameter of 48-52 mm will do for attaching the system. The Black Arm Complete is for people working with higher loads and carries between 5-32kg, therefore also compatible with e.g. the stabilized Newton remotehead. For ideal stabilization the system comes with four springs and dual dampers for each damper position.
